Can you change the battery in an old ipod

A well-cared-for iPhone or iPod can last many years, but there's a downside to that long life: eventually, you're going to need to consider a battery replacement. A mobile device that's used regularly can start to show decreased battery life after 18-24 months. If you've had your iPhone or iPod for two years or more, you've probably noticed that the battery holds less juice and that you need to recharge more often. [image credit: yasinguneysu/E+/Getty Images](#) You don't need to replace the battery as soon as those signs start to appear. And if you're still satisfied with everything else about your iPhone or iPod, you prefer to just replace the battery rather than buy a whole new device. The problem is that the battery on these devices is not (easily) replaceable by users because the casings have no doors or screws. So what are your options for iPhone or iPod battery replacement? Apple: Apple offers a battery replacement program for both in- and out-of-warranty devices through its retail stores and website. There are some conditions, but many older models should qualify. If you've got an Apple Store nearby, stop in and discuss your options. Otherwise, there's good information on Apple's website about both iPhone repair and iPod repair. Apple Authorized Service Providers: Apple isn't the only company that can provide repairs. There's also a network of authorized service providers whose staff has been trained and certified by Apple. When you get a repair from these stores, you can be sure that you're getting good, knowledgeable help and that your warranty will be protected (if your device is still under warranty). Repair Shops: Many websites and mall kiosks offer iPhone and iPod battery replacement services, often with prices lower than Apple's. Be wary of these options. Unless they're authorized by Apple, their staff may not be experts and they could accidentally damage your device. Do It Yourself: If you're handy, you can replace your device's battery yourself (though doing so will definitely void your warranty and means Apple won't help you if there are problems). This is a little trickier, but your favorite search engine can supply you with companies that sell the tools and battery you need. Make sure you've synced your iPhone or iPod to a computer before you start to back up all your data and know what you're doing. Otherwise, you could end up with a dead device. For the iPhone, Apple will service the battery on models as old as the iPhone 3GS up to the most recent. The company charges US\$49-\$69 for iPhone battery service, depending on the model. For the iPod, prices range from \$39 for an iPod Shuffle to \$79 for an iPod touch to \$149 for an iPod Classic. For iPods, Apple only services the battery on more recent models. If you've got an iPod that's a couple of generations old, you may have to find other repair options. Check with Apple to see if your model is covered. Replacing the dead or dying battery in your iPhone or iPod may seem like a good idea, but it may not be worth it. It depends on how old the device is. We recommend thinking about the issue like this: Is your iPhone still under warranty? Then yes, definitely replace the battery. With the warranty, the repair should be free or low cost. If it's recently out of warranty and still working well for your needs, it probably makes sense to replace the battery. If it's out of warranty and a couple of generations behind or a few years old, it probably doesn't make sense to replace the battery. In the last case, you need to weigh the cost of replacing the battery against the cost of a new device. For example, if you've got a 5th Gen. iPod touch that needs a new battery, that will cost you \$79. But buying a brand new iPod touch starts at just \$199, a little over \$100 more. For that price, you get all the latest hardware and software. Why not spend a bit more and get a much better device? You can avoid needing battery replacement as long as possible by taking good care of your battery. Apple suggests doing the following things to give your battery the longest possible lifespan: Keep your device in a cool area: iPhones and iPods function best when they're used in an ambient temperature between 32 and 95 degrees Fahrenheit (0-35 C). Operating the device outside of these temperatures can permanently damage the battery. You especially don't want to charge your device if the ambient temperature is above 95 degrees, as this can also damage the battery.Remove cases before charging: Some protective cases can cause your device to get too hot while charging. Taking off the case can help them stay cool while getting power.Charge the battery before long-term storage: If you're planning not to use your iPhone or iPod for a long time, charge its battery to 50% and then turn it off. If you store it for very long periods of time, charge it to 50% every 6 months. Thanks for letting us know! Tell us why! Our iPod Classic battery repair service will replace your faulty battery with a brand new functioning one. The iPod classic in 80GB, 120GB and 160GB originally introduced in 2007 until production ended with the largest capacity, 160gb in 2014 available in Black or Silver, model number A1238 Batteries with moderate to heavy use tend to last around 18 months and can start to bloat, after this time you may experience: iPod Classic battery dying too fast iPod Classic battery dying at 20 percent iPod Classic battery dying at 30 percent iPod Classic battery dying at 40 percent iPod Classic battery cutting out at 20 percent iPod Classic battery cuts out at 30 percent iPod Classic battery cuts out at 40 percent We will remove your faulty battery and install a brand new one. Once installed, we will test your handset and notify you that the repair is complete. Quality is important to us which is why we only use OEM parts with our iPod Classic battery replacements. We back this up with our 6 months performance warranty. by Tim Chesonis | Last Updated: March 20, 2020The iPod was first released nearly 20 years ago, (October 23, 2001), and served as the forerunner to the iPhone. It was designed to last several years, but can the battery be replaced, and if so, how much will it cost to replace?To replace the battery in your iPod, it will cost anywhere from \$39 to \$149 to have an Apple Technician replace it for you, depending on the model in question. In short, the older the unit, the more it will cost. To replace the battery of the latest iPod Touch, will only cost \$39.In this article, we will discuss battery longevity, Pro Tips you can implement to maximize and extend the battery life of your iPod Touch. We will also answer the question if it is even worth buying an iPod today, given that the iPhone does everything the iPod does and more. But before we begin, let's first point out that there are two ways that you can use an iPod. You can use it while connected to Wi-Fi, or you can download music, games, apps, and movies and watch them locally, (and by "locally", I mean without use of the internet). When the original iPod came out, it did not support Wi-Fi, and it would only play mp3 files. In fact, the original iPod was only designed to play music. Today's iPod will do everything the iPhone will do (with the exception of making phone calls), and even then, you could use FaceTime provided that you are connected via Wi-Fi to talk to people face to face. How Long is an iPod Battery Supposed to Last?On October 23, 2001, Apple introduced the first iPod which was touted as being able to "hold 1000 songs in your pocket." This scroll-wheel United had a 10 hour battery utilizing a 1200 mAh Lithium Polymer battery. Today, the latest iPod (iPod Touch, 7th generation), officially provides an estimated 40 hours of battery life for music playback and 8 hours for video playback.Before moving forward, it is important to understand that every single battery in the world has a life cycle. Batteries, like people, will eventually die. That is the nature of batteries. This is why you're your iPod Touch, (as well as other Apple products like the iPhone), allow for battery replacement.So, just how long is the battery in a brand new iPod touch supposed to last before it needs to be replaced? Well, after calling Apple Support directly, even they were not able to provide a definitive answer to this question. That's not a slam on Apple Support. If anything, it's probably because they don't run into battery replacement issues too often. People are probably apt to replace the unit as opposed to replacing the battery given how inexpensive and iPod touch is.I scoured Apple's website for the answer to this question and was not able to find a clear-cut answer. I then called AppleCare+ and asked them directly, and they told me that I should easily expect to get two or three years of use out of the battery before it needed to be replaced. That sounds very reasonable, considering that the battery is smaller than that found in an iPhone, which needs to be replaced once it hits a maximum capacity of 80%. The same rule applies for your iPod touch.To find out the maximum battery capacity that you iPod allows for right now, you simply need to open the Settings app, tap Battery, and then tap Battery Health. At the top of the screen, you will find the "Maximum Capacity" displayed on the right side of your screen. Once this number hits 80%, Apple recommends that you replace the battery. Doing so will breathe new life into your iPod.How Much Does it Cost to Replace the iPod Battery?Below is a list of all the iPods that Apple currently supports, and as such, Apple will replace the battery for any of the following units. ModelBattery ServiceiPod Shuffle(4th generation) 2010S39iPod nano (6th generation)\$59iPod touch 8 GB (3rd generation)\$79Pro Tips to Maximize and Extend the Battery Life on Your iPod TouchThere are certain things that you can do to extend the battery life on your iPod. If you implement these suggestions, you will not only extend the battery for daily use, but also the overall lifespan of the battery on your iPod.Update to the Latest Version of IOSKeeping your iPod up to date with the latest version of the operating system is key to ensuring that you have the ability to maximize the life of your battery. To ensure that you have the latest version, simply go to navigate to Settings > General > Software Update.Optimize your SettingsThe brightness of the display is the greatest determining factor in battery drainage. To combat this, you can dim the screen or turn Auto-Brightness on to extend your battery life.To dim your display, open Control Center by swiping down from the top of your home screen, and then drag the Brightness slider down. The more you drag it, the dimmer the display will appear.Alternately, you can opt to use the Auto-Brightness feature on your iPod touch. This will automatically adjust your screen to lighting conditions. To enable this, simply open the Settings App and tap on General > Accessibility > Display Accommodations and set Auto-Brightness to On.Enable Low Power ModeAccording to Apple's website:"If you want to extend the battery life on your iPhone, turn on Low Power Mode. This reduces power consumption until you turn it off or charge your iPod to 80%. When Low Power Mode is on, certain settings and features like app updates, downloads of new TV shows or podcast episodes, mail fetch, and some visual effects such as True Tone are reduced or disabled."Should I Replace the Battery or Simply Buy a New iPodThe answer to this question really depends on how old the iPod in question is and how would you use it. If you are sporting an iPod classic from 2009, buy a new one. The replacement battery for that iPod is \$179, and it does not have nearly all that the iPod touch has which only costs \$20 more.If you have an iPod that is only two or three years old, and he find that you need to replace the battery, you just may want to do that because it will only cost you \$39 to replace the battery that's a whole lot less expensive than purchasing a new unit at \$199.Is an iPod Worth Buying?So, why would you want to purchase an iPod Touch when it basically does everything an iPhone does with the exception of placing cellular phone calls?The iPod Touch is far Less Expensive. The entry price for the latest iPhone is \$699. The entry price for the latest iPod is \$199. That's a savings of \$500. The iPod Touch will literally do everything the iPhone does except place phone calls. It uses the exact same operating system (IOS), as the iPhone does. The iPod Touch is much smaller in size than even the smallest iPhone. It's thinner, lighter and easily fits into the tightest jeans or front pocket of a pair of kaki pants. It's a great "starter device" for kids. We all know that kids want an iPhone, but we also know that kids are learning how to be responsible. Entrusting them with a \$700 iPhone seems to me to be a great risk, considering that it could easily get lost or accidentally damaged. Purchasing an iPod gives your child nearly all the functionality of the iPhone for \$500 less. Closing ThoughtsThere is no question that Apple hit a home run when they first introduced the iPad back in 2001. Some would say that it put them on the map. It caused "Apple" to be come a household name. The fact that the iPod is now 19 years old, and is still selling units is remarkable.The iPod is a solid device that can play 40 hours of music non-stop or play 8 hours of video and yet easily fit into one's pocket is a testimony to the incredible engineering that went into this product. If you need all of the functionality of an iPhone without the ability to place cellular phone calls, then this is the product for you.report this adI find fulfillment in helping people and love working with computers, so I decided to use my skillset to help teach people how to use computers.The information provided at BasicComputerTips.com is for informational and/or educational purposes only.
